## Abstract

Link to NCBI BioProject on programmed cell death from RVIB Nathaniel B. Palmer NBP1302 in the Ross Sea from February to April 2013 (TRACERS project). NCBI BioProject 'Programmed cell death in the Ross Sea' may be accessed at <https://www.ncbi.nlm.nih.gov/bioproject/PRJNA350693>. Data include metagenome and transcriptome sequences from seawater samples.

## Methods & Sampling

### Sampling:

Water samples collected during the cruise aboard the research vessel icebreaker (RV/IB) Nathaniel B. Palmer, as part of the TRacing the fate of Algal Carbon Export in the Ross Sea (TRACERS) program included nutrients (nitrate, nitrite, silica, phosphate, DOC, DIC,  $\delta^{13}C$ , ). Samples for biological measurements were collected using a rosette sampler fitted with 20 12 L Niskin bottles (General Oceanics), a conductivity, temperature, and depth (CTD) sensor (Sea-Bird Electronics), an SBE 43 dissolved oxygen sensor, and a fluorometer (WET Labs). All seawater samples were stored immediately within 1 h of collection using HDPE amber bottles and all biological material was treated with 0.1% sodium azide ( $NaN_3$ ) solution and stored at 4°C until analysis.

### Metagenome samples:

Two liters of seawater were taken directly from Niskin bottles and filtered onto 47 mm diameter 0.22  $\mu m$  size pore polycarbonate filters (Millipore) and flash frozen in liquid nitrogen for storage until later analysis. DNA was extracted using the DNeasy Plant Mini Kit from QIAGEN. Illumina adapters and primers for sequencing on PCR products were used (TruSeq). 100 bp, PE reads were generated on the Illumina HiSeq 2500 platform.

### Metatranscriptome samples:

Two liters of seawater were taken directly from Niskin bottles and filtered onto 47 mm diameter 0.22  $\mu m$  size pore polycarbonate filters (Millipore) and flash frozen in liquid nitrogen for storage until later analysis. Illumina

ScripSeq kit was used for library prep and ribosomal depletion was done with Epidemiology kit.

Sorted cells metagenome samples:

Size and fluorescence sorted cells (2,000) were resuspended in PBS. Genome amplification was conducted with RepliG kit. Library preparation was conducted with TruSeq kit.

## Instruments

<b>Dataset-specific Instrument Name</b>	Illumina HiSeq 2500 platform
<b>Generic Instrument Name</b>	Automated DNA Sequencer
<b>Generic Instrument Description</b>	A DNA sequencer is an instrument that determines the order of deoxynucleotides in deoxyribonucleic acid sequences.

<b>Dataset-specific Instrument Name</b>	Sea-Bird Electronics
<b>Generic Instrument Name</b>	CTD Sea-Bird
<b>Dataset-specific Description</b>	To measure conductivity, temperature, and depth.
<b>Generic Instrument Description</b>	A Conductivity, Temperature, Depth (CTD) sensor package from SeaBird Electronics. This instrument designation is used when specific make and model are not known or when a more specific term is not available in the BCO-DMO vocabulary. Refer to the dataset-specific metadata for more information about the specific CTD used. More information from: <a href="http://www.seabird.com/">http://www.seabird.com/</a>

<b>Dataset-specific Instrument Name</b>	WET Labs
<b>Generic Instrument Name</b>	Fluorometer
<b>Dataset-specific Description</b>	To measure fluorescence
<b>Generic Instrument Description</b>	A fluorometer or fluorimeter is a device used to measure parameters of fluorescence: its intensity and wavelength distribution of emission spectrum after excitation by a certain spectrum of light. The instrument is designed to measure the amount of stimulated electromagnetic radiation produced by pulses of electromagnetic radiation emitted into a water sample or in situ.

<b>Dataset-specific Instrument Name</b>	General Oceanics
<b>Generic Instrument Name</b>	Niskin bottle
<b>Dataset-specific Description</b>	Used to collect water samples
<b>Generic Instrument Description</b>	A Niskin bottle (a next generation water sampler based on the Nansen bottle) is a cylindrical, non-metallic water collection device with stoppers at both ends. The bottles can be attached individually on a hydrowire or deployed in 12, 24, or 36 bottle Rosette systems mounted on a frame and combined with a CTD. Niskin bottles are used to collect discrete water samples for a range of measurements including pigments, nutrients, plankton, etc.

<b>Dataset-specific Instrument Name</b>	
<b>Generic Instrument Name</b>	Sea-Bird SBE 43 Dissolved Oxygen Sensor
<b>Dataset-specific Description</b>	To measure dissolved oxygen concentration
<b>Generic Instrument Description</b>	The Sea-Bird SBE 43 dissolved oxygen sensor is a redesign of the Clark polarographic membrane type of dissolved oxygen sensors. more information from Sea-Bird Electronics

<b>Dataset-specific Instrument Name</b>	
<b>Generic Instrument Name</b>	Thermal Cycler
<b>Generic Instrument Description</b>	A thermal cycler or "thermocycler" is a general term for a type of laboratory apparatus, commonly used for performing polymerase chain reaction (PCR), that is capable of repeatedly altering and maintaining specific temperatures for defined periods of time. The device has a thermal block with holes where tubes with the PCR reaction mixtures can be inserted. The cycler then raises and lowers the temperature of the block in discrete, pre-programmed steps. They can also be used to facilitate other temperature-sensitive reactions, including restriction enzyme digestion or rapid diagnostics. ## Project Information

### TRacing the fate of Algal Carbon Export in the Ross Sea (TRACERS)

**Coverage:** Ross Sea

Sinking particles are a major element of the biological pump and they are commonly assigned to two fates: mineralization in the water column and accumulation at the seafloor. However, there is another fate of export hidden within the vertical decline of carbon, the transformation of sinking organic matter to fine suspended and/or dissolved organic fractions. This process has been suggested but has rarely been observed or quantified. As a result, it is presumed that the solubilized fraction is largely mineralized over short time scales. However, global ocean surveys of dissolved organic carbon are demonstrating a significant water column accumulation of organic matter under high productivity environments. This proposal will investigate the transformation of organic particles from sinking to solubilized phases of the export flux in the Ross Sea. The Ross Sea experiences high export particle production, low dissolved organic carbon export with overturning

circulation, and the area has a predictable succession of production and export events. In addition, the basin is shallow (< 1000 m) so the products the PIs will target are relatively concentrated. To address the proposed hypothesis, the PIs will use both well-established and novel biochemical and optical measures of export production and its fate. The outcomes of this work will help researchers close the carbon budget in the Ross Sea.
