Parameters

Parameter	Description	Units
Date	Date of sampling	unitless
Flume	Four flumes were used - two ambient (~ 400 uatm) and two elevated pCO2 (target 1000 uatm)	unitless
Salinity	Salinity refers to the salinity for a given flume (parts per thousand)	PSU
Temp	Temp refers to the temperature for a given flume (deg C)	Celsius
pH	pH reports the pH for a given flume (Total Scale)	pH
pCO2	pCO2 reports the seawater pCO2 for a given flume (uatm)	uatm
TA	TA reports total alkalinity for a given flume (umol kgSW-1)	umol kgSW-1
OmegaAragonite	OmegaAragonite reports the aragonite saturation state for a given flume	umol kgSW-1
Paper	Paper the data were published in	unitless

Project Information

The ecophysiological basis of the response of coral larvae and early life history stages to global climate change (Climate_Coral_Larvae)

Coverage: Moorea, French Polynesia; Southern Taiwan; California State University Northridge

Tropical coral reefs face a suite of environmental assaults ranging from anchor damage to the effects of global climate change (GCC). The consequences are evident throughout the tropics, where many coral reefs have lost a substantial fraction of their coral cover in a

few decades. Notwithstanding the importance of reducing the impacts of environmental stresses, the only means by which these ecosystems can recover (or simply persist) is through the recruitment of scleractinians, which is a function of successful larval development, delivery, settlement, metamorphosis, and post-settlement events. Despite wide recognition of the importance of these processes, there are few pertinent empirical data, and virtually none that address the mechanisms mediating the success of early coral life stages in a physical environment varying at multiple spatio-temporal scales.

The objective of this research is to complete one of the first comprehensive ecophysiological analyses of the early life stages of corals through a description of: (1) their functionality under 'normal' conditions, and (2) their response to the main drivers of GCC. These analyses will be completed for 2 species representative of a brooding life history strategy, and the experiments will be completed in two locations, one (Taiwan) that provides unrivalled experience in coral reproductive biology, and superb microcosm facilities, and the other (Moorea), with access to a relatively pristine environment, a well described ecological and oceanographic context (through the MCR-LTER), and the capacity to bring a strong biogeographic contrast to the project. The results of the study will be integrated through modeling to explore the effects of GCC on coral community structure over the next century.
