## Abstract

This dataset reports concentrations of metals in total suspended particle (TSP) samples collected near Lake Tahoe from 2006 to 2009.

**Temporal Extent:** 2006-01-17 - 2009-10-13

## Methods & Sampling

TSP samples were collected between 2005 and 2010. Weekly integrated samples were collected on acid washed quartz fiber filters (10"x8", Whatman®) using a Graseby Andersen TSP High Volume Sampler. Between November 2005 and May 2007, the sampler was located near the lake at the UC Davis Field Station (Hatchery) away from any local source of disturbance. After May 2007, the sampler was relocated about 300 meters south to reduce local impacts due to remodeling at the Hatchery. The TSP sampler was placed 3.2 meters above the ground and protected by trees from direct road dust inputs. TSP samples were collected at an airflow rate of 85 cubic meters per hour. All filters were kept frozen until further analyses. To extract the soluble fraction of nutrients and trace metals in TSP samples, a 47 mm circular subsample of each filter was placed on an acid-washed filter tower, and 100 mL of MilliQ water was passed through the sample under gentle vacuum pressure exposing the sample for about 10 s to the water (Buck et al., 2006). A 100 µL of concentrated nitric acid was added to 5 mL of the MilliQ water for trace metal analysis.

TSP total and soluble trace metal concentrations of Al, V, Cr, Mn, Fe, Co, Ni, Cu, Cd, and Pb were analyzed by a High Resolution Inductively Coupled Plasma Mass Spectrometry (Element XR) with triple detector mode. Na, Mg, Ca, P, Zn, Sr, Ti, and U were also measured in bulk TSP and in the TSP soluble fraction samples, while total concentration of Ba was determined only in bulk TSP samples. Low resolution mode was used for Cd, Ba, Pb and U and medium resolution for the rest of the elements. Instrument calibration was done using gravimetrically prepared multi-element standards in the range of concentrations represented by our samples.

## Data Processing Description

### BCO-DMO Processing:

- changed date format to YYYY-MM-DD.

## Parameters

Parameter	Description	Units
Type	sample type: Bulk concentration of metals in TSP samples or Soluble concentration of metals in TSP samples	unitless
Date	Beginning date of TSP collection; format: YYYY-MM-DD	unitless
Cd	Cadmium concentration	nanograms per cubic meter (ng m-3)
Pb	Lead concentration	nanograms per cubic meter (ng m-3)
Ba	Barium concentration	nanograms per cubic meter (ng m-3)

U	Uranium concentration	nanograms per cubic meter (ng m-3)
Na	Sodium concentration	nanograms per cubic meter (ng m-3)
Mg	Magnesium concentration	nanograms per cubic meter (ng m-3)
Al	Aluminum concentration	nanograms per cubic meter (ng m-3)
P	Phosphorus concentration	nanograms per cubic meter (ng m-3)
Ca	Calcium concentration	nanograms per cubic meter (ng m-3)
Ti	Titanium concentration	nanograms per cubic meter (ng m-3)
V	Vanadium concentration	nanograms per cubic meter (ng m-3)
Cr	Chromium concentration	nanograms per cubic meter (ng m-3)
Mn	Manganese concentration	nanograms per cubic meter (ng m-3)
Fe	Iron concentration	nanograms per cubic meter (ng m-3)
Co	Cobalt concentration	nanograms per cubic meter (ng m-3)
Ni	Nickel concentration	nanograms per cubic meter (ng m-3)
Cu	Copper concentration	nanograms per cubic meter (ng m-3)
Zn	Zinc concentration	nanograms per cubic meter (ng m-3)
Sr	Strontium concentration	nanograms per cubic meter (ng m-3)

## Instruments

<b>Dataset-specific Instrument Name</b>	Graseby Andersen TSP High Volume Sampler
<b>Generic Instrument Name</b>	Aerosol Sampler
<b>Generic Instrument Description</b>	A device that collects a sample of aerosol (dry particles or liquid droplets) from the atmosphere.

<b>Dataset-specific Instrument Name</b>	Thermo Element XR high-resolution inductively coupled plasma mass spectrometer (HR-ICP-MS)
<b>Generic Instrument Name</b>	Inductively Coupled Plasma Mass Spectrometer
<b>Generic Instrument Description</b>	An ICP Mass Spec is an instrument that passes nebulized samples into an inductively-coupled gas plasma (8-10000 K) where they are atomized and ionized. Ions of specific mass-to-charge ratios are quantified in a quadrupole mass spectrometer.

## Project Information

### Atmospheric Deposition Impacts on Marine Ecosystems (ADIMA)

**Website:** [http://pmc.ucsc.edu/~apaytan/page\\_projects.html](http://pmc.ucsc.edu/~apaytan/page_projects.html)

**Coverage:** Gulf of Aqaba, Atlantic Ocean (Bermuda Time Series Station), Monterey Bay

Chemical components delivered to the surface ocean through atmospheric deposition influence ocean productivity and ecosystem structure thus are tightly related to the global carbon cycle and climate. Accordingly, the major aim of this project is to quantitatively estimate the variable impact of aerosols on marine phytoplankton and to determine the specific effects on various taxa. Such data could in the future be used to better understand the global impact of aerosols on the oceanic ecosystem. To accomplish this goal the PI will monitor aerosol dry deposition fluxes, determine aerosol sources, obtain the chemical composition and solubility of aerosols, and evaluate the contribution of aerosols to nutrient and trace metal budgets of seawater at two oceanographically different sites (Bermuda and Monterey Bay) representing open ocean and coastal setting. The effects of the different aerosol "types" (defined by source and chemical characteristics) on specific phytoplankton taxa will also be evaluated using pure culture and natural samples bioassays. This project is particularly important in light of the role atmospheric deposition can resume in oligotrophic and coastal settings and the predicted future global conditions of increased aridity and urbanization and associated changes in dust fluxes and composition.
