Data Management Plan
 Our project will focus on data analysis and model building, and we are not planning to generate new datasets. The majority of the data used by our project will consist of physical, biological, and economic data collected and archived by other organizations, such as NOAA, NASA, and Maine DMR. The downscaled climate projections will be served through NOAA's websites.

 If we do have the opportunity to collect new data, we will submit it to BCO-DMO. We plan to make the source code for our models available for download from our website, SeascapeModeling.org. We will also work with any journals to archive the model input and code necessary to reproduce published results.
